

Autism Assessment Results

Child Information: Age: 23 years, Gender: Male

Assessment Date: April 26, 2025

Summary of Results

Overall Assessment: Low alignment with autism characteristics
Probability score: 29.3%

Domain Scores

Domain	Score (out of 10)	Level
Pattern Recognition & Detailed Perception	8.2	High
Sensory Processing	7.2	High
Social Communication	8.6	High
Repetitive Behaviors & Focused Interests	7.4	High

Domain-Specific Insights

Pattern Recognition & Detailed Perception (High alignment)

Your responses indicate your child shows strong characteristics of detailed perception and pattern recognition often associated with autism. They likely notice small details others miss, may excel at pattern-based activities, and might focus intensely on specific details rather than seeing the 'big picture.' These traits can be strengths in many contexts, such as mathematics, science, quality control, or detail-oriented work.

Sensory Processing (High alignment)

Your responses indicate your child has significant sensory processing differences that align with autism. They may be highly sensitive to certain sensory inputs (sounds, textures, lights), seek specific sensory experiences, or be under-responsive to other sensations. Understanding and accommodating these sensory needs can significantly improve their comfort and functioning.

Social Communication (High alignment)

Your responses indicate your child has social communication characteristics that strongly align with autism. They may process social information in a more analytical way, find aspects of social

communication challenging, or have a more literal understanding of language. These different approaches to social understanding are central aspects of autism.

Repetitive Behaviors & Focused Interests (High alignment)

Your responses indicate your child shows patterns of intense interests and/or repetitive behaviors that strongly align with autism. They may have deep knowledge in specific areas of interest, prefer consistent routines, or engage in repetitive behaviors. These focused interests can be significant strengths and sources of expertise and joy.

Next Steps

The assessment indicates a low alignment with autism characteristics. While this suggests your child's development patterns are more neurotypical, if you have specific concerns about certain behaviors or developmental aspects, you can always discuss them with your child's healthcare provider.
